

A study on impact of Artificial Intelligence on employment in India

Dr. Manisha Dave, Associate Professor, ABST, Government Girls College, Magra Punjala Jodhpur

Abstract

Artificial Intelligence is a set of technologies that enable computers to perform a variety of advanced functions. It is a method of making a computer, a computer-controlled robot, or a software think intelligently like human mind. It is revolutionizing industries by automating tasks, optimizing decision-making and fostering innovation across fields like healthcare, education and finance. AI has both positive and negative impact on employment. It can create new jobs, but it can also displace workers. It can impact employment in three ways: First, it can complement human in some tasks; second it can altogether replace human in some other tasks and third it can generate new types of work for humans. This paper studies the level of impact of this technological development on employment and jobs in India.
