## Study on σ-Statistical Convergence and its theorem

Nadimpally Srinivasulu Goud Research Scholar, Department Of Mathematics, Monad University, Hapur, Uttar Pradesh (India)

Dr. Rajeev Kumar Associate Professor, Department Of Mathematics, Monad University, Hapur, Uttar Pradesh (India)

### Abstract:

The mappings  $\sigma$  are one-to-one and such that  $\sigma m(ok) \neq ok$  for all advantageous integers ok and m, wherein  $\sigma m(ok)$  denotes the mth iterate of the mapping  $\sigma$  at ok. Thus  $\Phi$  extends the restrict useful on c, the distance of convergent sequences, withinside the experience that  $\Phi(x) = \lim \xi k$  for all  $x \in c$ . In case  $\sigma$  is the interpretation mapping  $ok \rightarrow ok+1$ , an invariant suggest is frequently known as a Banach restrict and  $V\sigma$ , the set of bounded sequences all of whose invariant approach are equal, is the set of just about convergent sequences

# **Keywords: SOLUTION, STATISTICAL. CONVERGENCE AND LACUNARY Introduction**

Convergence of random variables (sometimes called stochastic convergence) is where a set of numbers settle on a particular number. It works the same way as convergence anywhere else; For example, cars on a 5-line highway might converge to one specific lane if there's an accident closing down four of the other lanes. In the same way, a sequence of numbers (which could represent cars or anything else) can <u>converge</u> (mathematically, this time) on a single, specific number. Certain processes, distributions and events can result in convergence—which basically mean the values will get closer and closer together.

The main object of this paper is to study two more extensions of the concept of statistical convergence namely  $\sigma$ -statistical convergence and lacunary  $\sigma$ -statistical convergence. We also study the concept of L<sub>0</sub>-convergence. In section 1.2 we study some inclusion relations between L<sub>0</sub>-convergence and lacunary  $\sigma$ -statistical convergence and show that these are equivalent for bounded sequences. Further in section 1.3 we study relation between  $\sigma$ -statistical convergence and lacunary  $\sigma$ -statistical convergence.

**Definition 1.1.1.** Let  $\sigma$  be a mapping of the set of positive integers into itself. A continuous linear functional  $\Phi$  on  $l_{\infty}$ , the space of real bounded sequences  $x = \{\xi_k\}$ , is said to be an invariant mean or a  $\sigma$ -mean if and only if

- 1.  $\Phi(x) \ge 0$  if  $\xi_k \ge 0$  for all k,
- 2.  $\Phi(\{\xi_{\sigma(k)}\}) = \Phi(x)$  for all  $x \in l_{\infty}$ ,
- 3.  $\Phi(e) = 1$  where  $e = \{1, 1, 1, ...\}$ .

The mappings  $\sigma$  are one-to-one and such that  $\sigma^m(k) \neq k$  for all positive integers k and m, where  $\sigma^m(k)$  denotes the  $m^{th}$  iterate of the mapping  $\sigma$  at k. Thus  $\Phi$  extends the limit functional on c, the space of convergent sequences, in the sense that  $\Phi(x) = \lim \xi_k$  for all  $x \in c$ . In case  $\sigma$  is the translation mapping  $k \rightarrow k+1$ , an invariant mean is often called a Banach limit and  $V_{\sigma}$ , the set of bounded sequences all of whose invariant means are equal, is the set of almost convergent sequences [19].

If 
$$x = \{\xi_k\}$$
, set  $Tx = \{T\xi_k\} = \{\xi_{\sigma(k)}\}$ . It can be shown [28] that

$$V_{\sigma} = \{x = \{\xi_k\} \colon \lim_{m \to \infty} t_{mk}(x) = \xi e \text{ uniformly in } k, \, \xi = \sigma\text{-lim } \xi_k\}$$

$$\label{eq:where t_mk} \text{where } t_{mk}(x) \ = \frac{\left(\xi_k + T\xi_k + ... + T^m\xi_k\right)}{m+1} \,.$$

Several authors including Mursaleen [22], Savas [27], Schaefer [31] and others have studied invariant convergent sequences.

**Definition 1.1.2.** A sequence  $x = \{\xi_k\}$  is said to be strongly  $\sigma$ -convergent [23] to  $\xi$  if

$$\lim_{n\to\infty}\frac{1}{n}\sum_{k=0}^{n-1}|\,\xi_{\sigma^k(m)}-\xi|=0\qquad \quad uniformly\ in\ m.$$

In this case we write  $\xi_k \to \xi[V_{\sigma}]$  and  $[V_{\sigma}]$  denotes the set of all strongly convergent sequences.

International Advance Journal of Engineering, Science and Management (IAJESM) ISSN -2393-8048, July-December 2020, Submitted in October 2020, jajesm2014@gmail.com

#### **Remark 1.1.3.**

- For  $\sigma(m) = m+1$ , the space  $[V_{\sigma}]$  is the space of strongly almost convergent sequences. (i)
- (ii) It is known [23] that  $c \subset [V_{\sigma}] \subset V_{\sigma} \subset l_{\infty}$ .

**Definition 1.1.4.** A lacunary sequence is an increasing integer sequence  $\theta = \{k_r\}$  such that  $k_0$ = 0 and  $h_r = k_r - k_{r-1} \rightarrow \infty$  as  $r \rightarrow \infty$ .

Throughout this paper the intervals determined by  $\theta$  will be denoted by  $I_r = (k_{r-1})$  $_1$ ,  $k_r$ ].

**Definition 1.1.5.** Let  $\theta$  be a lacunary sequence. The space denoted by  $N_{\theta}$  is defined [9] as

$$N_\theta = \{x = \{\xi_k\}\colon \text{for some } \xi, \ \lim_{r \to \infty} \frac{1}{h_r} \sum_{k \in L} \mid \xi_k - \xi \rvert = 0\}\,.$$

**Definition 1.1.1.** A sequence  $x = \{\xi_k\}$  is said to be lacunary strong  $\sigma$ -convergent [28] to  $\xi$  if

$$\lim_{r\to\infty}\frac{1}{h_r}\sum_{k\in I_r}|\,\xi_{\sigma^k(m)}-\xi|=0\qquad \quad uniformly\ in\ m.$$

We shall denote by  $L_{\theta}$  the set of all lacunary strong  $\sigma$ -convergent sequences.

**Remark 1.1.1.**  $L_{\theta} \Leftrightarrow [V_{\sigma}]$  for every lacunary sequence  $\theta$ .

**Definition 1.1.8.** A complex number sequence  $x = \{\xi_k\}$  is said to be  $\sigma$ -statistically convergent or  $S_{\sigma}$ -convergent to the number  $\xi$  if for each  $\varepsilon > 0$ 

$$\lim_{n\to\infty}\frac{1}{n}|\{0\leq k\leq n\colon |\xi_{\sigma^k(m)}-\xi|\geq \epsilon\}|=0\qquad \text{uniformly in }m.$$
 In this case we write  $S_\sigma\text{-lim }\xi_k=\xi \text{ or }\xi_k\to \xi(S_\sigma) \text{ and }S_\sigma \text{ denotes the set of all }$ 

σstatistically convergent sequences.

**Definition 1.1.9.** Let  $\theta = \{k_r\}$  be a lacunary sequence. The complex number sequence x = 1 $\{\xi_k\}$  is said to be lacunary  $\sigma$ -statistically convergent or  $S_{\sigma\theta}$ -convergent to the number  $\xi$  if for each  $\epsilon > 0$ 

$$\lim_{r\to\infty}\frac{1}{h_r}\left|\{k\in I_r:|\,\xi_{\sigma^k(m)}-\xi|\geq\epsilon\}\right|=0\quad \text{uniformly in }m.$$

In this case we write  $S_{\sigma\theta}$ -lim  $\xi_k = \xi$  or  $\xi_k \to \xi(S_{\sigma\theta})$  and  $S_{\sigma\theta}$  denotes the set of all lacunary  $\sigma$ statistically convergent sequences.

#### Some Inclusion Relations Between L<sub>θ</sub>-Convergence And Lacunary Σ-Statistical 1.2 Convergence

In his section we study some inclusion relations between L<sub>θ</sub>-convergence and lacunary σ-statistical convergence and show that these are equivalent for bounded sequences.

**Theorem 1.4.1.** Let  $\theta = \{k_r\}$  be a lacunary sequence. Then

- (i)  $\xi_k \to \xi(L_\theta) \Rightarrow \xi_k \to \xi(S_{\sigma\theta}),$
- if  $x \in l_{\infty}$  and  $\xi_k \to \xi(S_{\sigma\theta})$ , then  $\xi_k \to \xi(L_{\theta})$ , (ii)
- $S_{\sigma\theta} \cap l_{\infty} = L_{\theta}$ . (iii)

**Proof.** (i). Since  $\xi_k \to \xi(L_\theta)$ , for each  $\epsilon > 0$ , we have

$$\lim_{r \to \infty} \frac{1}{h_r} \sum_{k \in I_r} |\xi_{\sigma^k(m)} - \xi| = 0 \qquad \text{uniformly in m.} \qquad \dots (1)$$

If  $\varepsilon > 0$ , we can write

$$\begin{split} \sum_{k \in I_r} &|\; \xi_{\sigma^k(m)} - \xi| \geq \sum_{k \in I_r} &|\; \xi_{\sigma^k(m)} - \xi| \\ &|\; |\xi_{\sigma^k(m)} - \xi| \geq \epsilon \\ &\geq \epsilon |\{ k \in I_r \colon |\; \xi_{\sigma^k(m)} - \xi| \geq \epsilon \}| \end{split}$$

Consequently,

$$\underset{r\to\infty}{\text{lim}}\frac{1}{h_r}\sum_{k\in I_r} \mid \xi_{\sigma^k(m)} - \xi \rvert \geq \epsilon \underset{r\to\infty}{\text{lim}}\frac{1}{h_r} \mid \{k\in I_r : \mid \xi_{\sigma^k(m)} - \xi \rvert \geq \epsilon\} \rvert$$

Hence by (1) and the fact that  $\varepsilon$  is fixed number, we have

International Advance Journal of Engineering, Science and Management (IAJESM) ISSN -2393-8048, July-December 2020, Submitted in October 2020, iajesm2014@gmail.com

$$\lim_{r\to\infty}\,\frac{1}{\mathsf{h}_r}\left|\{k\in I_r\!\!: |\,\xi_{\sigma^k(\mathsf{m})}-\xi|\geq\epsilon\}\right|=0\quad \text{uniformly in } m,$$

i.e.  $\xi_k \to \xi(S_{\sigma\theta})$ .

(ii). Suppose that  $\xi_k \to \xi(S_{\sigma\theta})$  and  $x \in l_{\infty}$ . Then for each  $\epsilon > 0$ 

$$\lim_{r\to\infty}\frac{1}{h_r}|\{k\in I_r: |\xi_{\sigma^k(m)}-\xi|\geq\epsilon\}|=0 \quad \text{uniformly in m.} \qquad ...(2)$$

Since  $x \in l_{\infty}$ , there exists a positive real number M such that  $|\xi_{\sigma^k(m)} - \xi| \leq M$  for all k and m.

For given  $\varepsilon > 0$ , we have

$$\begin{split} \frac{1}{h_r} \sum_{k \in I_r} \mid \xi_{\sigma^k(m)} - \xi \rvert &= \frac{1}{h_r} \sum_{k \in I_r} \mid \xi_{\sigma^k(m)} - \xi \rvert + \frac{1}{h_r} \sum_{k \in I_r} \mid \xi_{\sigma^k(m)} - \xi \rvert \\ &\leq \frac{1}{h_r} \sum_{k \in I_r} M + \frac{1}{h_r} \sum_{k \in I_r} \epsilon \\ &= \frac{M}{h_r} \mid \{ k \in I_r \colon \mid \xi_{\sigma^k(m)} - \xi \rvert \geq \epsilon \} \mid + \epsilon \frac{1}{h_r} \left[ n - (n - h_r + 1) + 1 \right] \\ &= \frac{M}{h_r} \mid \{ k \in I_r \colon \mid \xi_{\sigma^k(m)} - \xi \rvert \geq \epsilon \} \mid + \epsilon \frac{1}{h_r} h_r \\ &= \frac{M}{h_r} \mid \{ k \in I_r \colon \mid \xi_{\sigma^k(m)} - \xi \rvert \geq \epsilon \} \mid + \epsilon \end{split}$$
 
$$\Rightarrow \lim_{r \to \infty} \frac{1}{h_r} \sum_{k \in I_r} \mid \xi_{\sigma^k(m)} - \xi \rvert \leq M \lim_{r \to \infty} \frac{1}{h_r} \mid \{ k \in I_r \colon \mid \xi_{\sigma^k(m)} - \xi \rvert \geq \epsilon \} \mid + \epsilon \end{split}$$

Hence by using (2), we get

$$\lim_{r \to \infty} \frac{1}{h_r} \sum_{k \in I_r} |\xi_{\sigma^k(m)} - \xi| = 0 \qquad \text{uniformly in m.} \qquad \dots(3)$$

$$\xi_k \to \xi(L_\theta).$$

**Example 1.2.2.** Let  $\theta$  be given and define  $\xi_k$  to be 1,2,3,...,  $[\sqrt{h_r}]$  for  $k = \sigma^n(m)$ , 1,  $k_{r-1}+2,...,k_{r-1}+\lceil \sqrt{h_r} \rceil$ ;  $m \ge 1$  and  $\xi_k=0$  otherwise (where  $\lceil \rceil$  denotes the greatest integer function).

Note that x is not bounded. Now

$$\frac{1}{\mathsf{h}_r}\left|\{k\in I_r: |\xi_{\sigma^k(\mathsf{m})}-0|\geq\epsilon\}\right| = \frac{[\sqrt{\mathsf{h}_r}\,]}{\mathsf{h}_r} \to 0 \text{ as } r\to\infty,$$

i.e.  $\xi_k \to 0(S_{\sigma\theta})$ . But

$$\frac{1}{h_r}\sum_{k\in I_r}\mid \xi_{\sigma^k(m)}-0\mid =\frac{1}{h_r}\left(\left[\sqrt{h_r}\right]\frac{\left(\left[\sqrt{h_r}\right]+1\right)}{2}\right) \to \frac{1}{2}\neq 0 \text{ as } r\to \infty,$$

i.e.  $\xi_k \rightarrow 0(L_\theta)$ .

Thus inclusion in (i) is proper and this example shows that the boundedness condition can not be omitted from (ii).

(iii). It follows from (i), (ii), Remark 1.1.7 and the fact that  $[V_{\sigma}] \subset l_{\infty}$ .

This completes the proof of the theorem.

In this section we study relation between  $S_{\sigma}$ -convergence and  $S_{\sigma\theta}$ -convergence. First we discuss a lemma which will be used in studying that relation.

**Lemma 1.4.1.** A sequence  $x = \{\xi_k\}$  is  $\sigma$ -statistically convergent to the number  $\xi$  if for given  $\epsilon_1 > 0$  and each  $\epsilon > 0$ , there exist  $n_0$  and  $m_0$  such that

$$\frac{1}{n} \big| \big\{ 0 \le k \le n - 1 \colon |\xi_{\sigma^k(m)} - \xi| \ge \epsilon \big\} \big| < \epsilon_1$$

International Advance Journal of Engineering, Science and Management (IAJESM) ISSN -2393-8048, July-December 2020, Submitted in October 2020, <u>iajesm2014@gmail.com</u> for all  $n \ge n_0$  and  $m \ge m_0$ .

**Proof.** Let  $\varepsilon_1 > 0$  be given. For each  $\varepsilon > 0$ , choose  $n_0$  and  $m_0$  such that

$$\frac{1}{n} \big| \big\{ 0 \le k \le n-1 \colon |\xi_{\sigma^k(m)} - \xi| \ge \epsilon \big\} \big| < \frac{\epsilon_1}{2} \qquad \qquad \dots (4)$$

for all  $n \ge n_0$  and  $m \ge m_0$ .

It is enough to prove that there exists  $n_0$ " such that for  $n \ge n_0$ ",  $0 \le m \le m_0$ ,

$$\frac{1}{n} |\{0 \le k \le n-1: |\xi_{\sigma^{k}(m)} - \xi| \ge \epsilon\}| < \epsilon_{1} \qquad \dots (5)$$

since taking  $n_0 = max \{n_0', n_0''\}$ , (5) will hold for  $n \ge n_0$  and for all m, which gives the result. Once  $m_0$  has been chosen,  $0 \le m \le m_0$ ,  $m_0$  is fixed.

So let 
$$|\{0 \le k \le m_0 - 1: |\xi_{\sigma^k(m)} - \xi| \ge \epsilon\}| = K$$
.

Now taking  $0 \le m \le m_0$  and  $n \ge m_0$ , we have

$$\begin{split} \frac{1}{n}|\{0 \leq k \leq n-1\colon |\xi_{\sigma^k(m)} - \xi| \geq \epsilon\}| &= \frac{1}{n}|\{0 \leq k \leq m_0-1\colon |\xi_{\sigma^k(m)} - \xi| \geq \epsilon\}| \\ &\qquad \qquad + \frac{1}{n}|\{m_0 \leq k \leq n-1\colon |\xi_{\sigma^k(m)} - \xi| \geq \epsilon\}| \\ &\leq \frac{1}{n}K + \frac{\epsilon_1}{2} & [Using~(4)] \\ &< \epsilon_1 & [Taking~n~sufficiently~large] \end{split}$$

which gives (5), and hence the result follows.

**Theorem 1.3.2.**  $S_{\sigma\theta} = S_{\sigma}$  for every lacunary sequence  $\theta$ .

**Proof.** Let  $x \in S_{\sigma\theta}$ . Then from Definition 1.1.9, given  $\varepsilon_1 > 0$ , there exist  $r_0$  and  $\xi$  such that

$$\frac{1}{\mathsf{h}_r} \left| \left\{ 0 \le k \le \mathsf{h}_r - 1 \colon \left| \, \xi_{\sigma^k(\mathsf{m})} - \xi \right| \ge \epsilon \right\} \right| < \epsilon_1$$

for  $r \ge r_0$  and  $m = k_{r-1} + 1 + u$ ,  $u \ge 0$ .

Let  $n \ge h_r$  and write  $n = ih_r + t$  where  $0 \le t \le h_r$ , i is an integer. Since  $n \ge h_r$ , it follows that  $i \ge 1$ .

Now

$$\begin{split} \frac{1}{n} | \{ 0 \leq k \leq n - 1 \colon |\, \xi_{\sigma^k(m)} - \xi | \geq \epsilon \} | &\leq \frac{1}{n} | \{ 0 \leq k \leq (i + 1) h_r - 1 \colon |\, \xi_{\sigma^k(m)} - \xi | \geq \epsilon \} | \\ &= \frac{1}{n} \sum_{j=0}^i |\, \{ j h_r \leq k \leq (j + 1) h_r - 1 \colon |\, \xi_{\sigma^k(m)} - \xi | \geq \epsilon \} | \\ &\leq \frac{1}{n} (i + 1) h_r \, \epsilon_1 \\ &\leq 2i \, h_r \frac{\epsilon_1}{n} \end{split} \qquad \qquad [i \geq 1]$$

for 
$$\frac{h_r}{n} \le 1$$
, since  $\frac{ih_r}{n} \le 1$ . So

$$\frac{1}{n}|\{0\leq k\leq n-1\colon |\,\xi_{\sigma^k(m)}-\xi|\geq \epsilon\}|\leq 2\epsilon_1.$$

Then, by Lemma 1.4.1,  $x \in S_{\sigma}$ .

Thus  $S_{\sigma\theta} \subset S_{\sigma}$ .

It is easy to see that  $S_{\sigma} \subset S_{\sigma\theta}$ .

Hence  $S_{\sigma\theta} = S_{\sigma}$  for every lacunary sequence  $\theta$ .

This completes the proof of the theorem.

**Remark 1.3.3.** When  $\sigma(m) = m + 1$ , from Definition 1.1.8 and Definition 1.1.9, we have the definitions of almost statistical convergence and lacunary almost statistical convergence of a sequence.
